---

---

---

---

---

---

---

---

### Review of Option Types

- ✦ A call is an option to buy
- ✦ A put is an option to sell
- ✦ A European option can be exercised only at the end of its life
- ✦ An American option can be exercised at any time

2

---

---

---

---

---

---

---

---

### Payoffs from Options

What is the Option Position in Each Case?

$K$  = Strike price,  $S_T$  = Price of asset at maturity

Payoff

Payoff

Payoff

Payoff

3

---

---

---

---

---

---

---

---

### Assets Underlying Exchange-Traded Options

- ✦ Stocks: VALE5,PETR4,OGX
- ✦ Foreign Currency
- ✦ Stock Indices  
SP500(SPX), Ibovespa (IBV),Euro stoxx50 (FESX)
- ✦ Futures
- ✦ BTC

4

---

---

---

---

---

---

---

---

### Specification of Exchange-Traded Options

- ✦ Expiration date
- ✦ Strike price
- ✦ European or American
- ✦ Call or Put (option class)

5

---

---

---

---

---

---

---

---

### Terminology

Moneyness :

- ❑ At-the-money option
- ❑ In-the-money option
- ❑ Out-of-the-money option

6

---

---

---

---

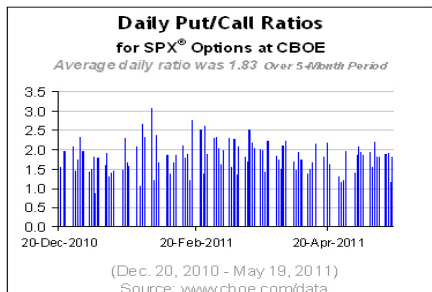

---

---

---

---

## Puts vs Calls

---

---

---

---

---

---

---

---

## Actual Data

- ✦ [Put-Call ratio August, 2019](#)
- ✦ [S&P500](#)
- ✦ [Dec 21th, 2018](#)

8

---

---

---

---

---

---

---

---

## Properties of Stock Options

Prf. José Fajardo  
Fundação Getulio Vargas

9

---

---

---

---

---

---

---

---

## Notation

$c$ :	European call option price	$C$ :	American call option price
$p$ :	European put option price	$P$ :	American put option price
$S_0$ :	Stock price today	$S_T$ :	Stock price at option maturity
$K$ :	Strike price	$D$ :	PV of dividends paid during life of option
$T$ :	Life of option	$r$ :	Risk-free rate for maturity $T$ with cont. comp.
$\sigma$ :	Volatility of stock price		

10

---

---

---

---

---

---

---

---

## Effect of Variables on Option Pricing

Variable	$c$	$p$	$C$	$P$
$S_0$	+	-	+	-
$K$	-	+	-	+
$T$	?	?	+	+
$\sigma$	+	+	+	+
$r$	+	-	+	-
$D$	-	+	-	+

11

---

---

---

---

---

---

---

---

## American vs European Options

An American option is worth at least as much as the corresponding European option

$$C \geq c$$

$$P \geq p$$

12

---

---

---

---

---

---

---

---

## Calls: An Arbitrage Opportunity?

✦ Suppose that

$$\begin{array}{ll} c = 3 & S_0 = 20 \\ T = 1 & r = 10\% \\ K = 18 & D = 0 \end{array}$$

✦ Is there an arbitrage opportunity?

13

---

---

---

---

---

---

---

---

---

---

## Lower Bound for European Call Option Prices; No Dividends

$$c \geq S_0 - Ke^{-rT}$$

14

---

---

---

---

---

---

---

---

---

---

## Puts: An Arbitrage Opportunity?

✦ Suppose that

$$\begin{array}{ll} p = 1 & S_0 = 37 \\ T = 0.5 & r = 5\% \\ K = 40 & D = 0 \end{array}$$

✦ Is there an arbitrage opportunity?

15

---

---

---

---

---

---

---

---

---

---

### Lower Bound for European Put Prices; No Dividends

$$p \geq Ke^{-rT} - S_0$$

16

---

---

---

---

---

---

---

---

### Put-Call Parity: No Dividends

- Consider the following 2 portfolios:
  - Portfolio A: European call on a stock + zero-coupon bond that pays  $K$  at time  $T$
  - Portfolio B: European put on the stock + the stock

17

---

---

---

---

---

---

---

---

### Values of Portfolios

		$S_T > K$	$S_T < K$
Portfolio A	Call option	$S_T - K$	0
	Zero-coupon bond	$K$	$K$
	Total	$S_T$	$K$
Portfolio B	Put Option	0	$K - S_T$
	Share	$S_T$	$S_T$
	Total	$S_T$	$K$

18

---

---

---

---

---

---

---

---

## The Put-Call Parity Result

- Both are worth  $\max(S_T, K)$  at the maturity of the options
- They must therefore be worth the same today. This means that

$$c + Ke^{-rT} = p + S_0$$

19

---

---

---

---

---

---

---

---

## Arbitrage Opportunities

- Suppose that

$$\begin{array}{ll} c = 3 & S_0 = 31 \\ T = 0.25 & r = 10\% \\ K = 30 & D = 0 \end{array}$$

- What are the arbitrage possibilities when

$$\begin{array}{l} p = 2.25 ? \\ p = 1 ? \end{array}$$

20

---

---

---

---

---

---

---

---

## Early Exercise

- Usually there is some chance that an American option will be exercised early
- An exception is an American call on a non-dividend paying stock
- This should never be exercised early

21

---

---

---

---

---

---

---

---

### An Extreme Situation

- ✦ For an American call option:  
 $S_0 = 100; T = 0.25; K = 60; D = 0$   
 Should you exercise immediately?
- ✦ What should you do if
  - ▣ You want to hold the stock for the next 3 months?
  - ▣ You do not feel that the stock is worth holding for the next 3 months?

22

---

---

---

---

---

---

---

---

### Reasons For Not Exercising a Call Early (No Dividends)

- ✦ No income is sacrificed
- ✦ You delay paying the strike price
- ✦ Holding the call provides insurance against stock price falling below strike price

23

---

---

---

---

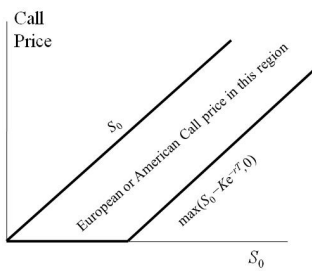

---

---

---

---

### Bounds for European or American Call Options (No Dividends)

24

---

---

---

---

---

---

---

---

### Should Puts Be Exercised Early ?

Are there any advantages to exercising an American put when

$$S_0 = 60; T = 0.25; r = 10\%$$

$$K = 100; D = 0$$

25

---

---

---

---

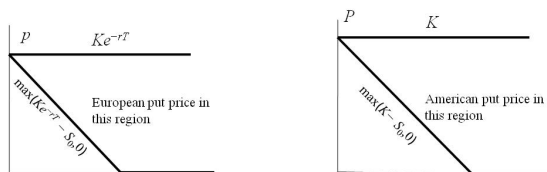

---

---

---

---

### Bounds for European and American Put Options (No Dividends)

26

---

---

---

---

---

---

---

---

### The Impact of Dividends on Lower Bounds to Option Prices

$$c \geq S_0 - D - Ke^{-rT}$$

$$p \geq D + Ke^{-rT} - S_0$$

27

---

---

---

---

---

---

---

---

## Extensions of Put-Call Parity

- American options;  $D = 0$

$$S_0 - K < C - P < S_0 - Ke^{-rT}$$

- European options;  $D > 0$

$$c + D + Ke^{-rT} = p + S_0$$

- American options;  $D > 0$

$$S_0 - D - K < C - P < S_0 - Ke^{-rT}$$

28

---

---

---

---

---

---

---

---

## Put-Call Duality

Rajarado and Mordecki (2006): For calls and puts in the same underlying American or Europeans

$$C(S_0, K, r, \delta, T, \sigma) = P(K, S_0, \delta, r, T, \sigma)$$

With Jumps

$$C(S_0, K, r, \delta, T, \pi) = P(K, S_0, \delta, r, T, \pi)$$
